

IT'S TIME FOR TELEMEDICINE.

# Engaging Patients

to Enroll and Participate in your RPM Program

Promoting the value of RPM to your patients based on their own responsibility to their health, the ability of self tracking and the ability to engage you as their provider in their health management is critical. Share with them stories of how RPM systems have been shown to catch early heart disease such as increasing hypertension or atrial fibrillation, manage COPD, diabetes, high risk pregnancies among others. Despite a demonstrated ability to engage patients of any age group, some hesitation persists among

care providers and patients to utilize RPM due to a misperception that it requires a high level of technological skill.

Cura RPM requires a minimum level of effort. In January of 2021 the CuraConnect hub will lower that effort to simply taking the physiologic measure. Until that time, and under more cost effective roles, the patient user needs a minimum ability to select a link (no login required), enter data, and select submit data button on a mobile device or computer.
