

IT'S TIME FOR TELEMEDICINE.

# Selecting the Right Patient Population

Many disease conditions are able to benefit from remote patient monitoring. Robust studies have shown great benefit in COPD, asthma, diabetes, and heart disease. Nonetheless value is delivered to other disease states including pain management patients, obesity, inactivity, temporary disease states such as Covid-19 and much more. Understanding the wide range of patients that may value from remote patient monitoring CMS has intentionally not limited the available patient populations as for example as seen in Chronic care management.
